## No modules showing in full text view

Posted by m\_13 - 2007/12/01 10:35

---

Thanks for AlphaContent - I'm loving it!

I have a problem though. When you navigate to articles in full text view via AlphaContent the right hand modules that should display disappear.

Our site? <http://www.sineadquinn.info>

I'm using AlphaContent as 'Search'.

Click on any of the articles on the homepage and you'll see that the side modules show content.

Visit 'search' and click on any of the articles through AlphaContent and you'll see that the modules down the right hand side are no longer shown.

I'd like this to work as we are using the modules for cross-promotion.

Any ideas :(

Check your params of you modules which disappear.

If no run again, try to create a new menu linked to the blogs sections/categories used by AlphaContent. Publish it in a new module menu: unpublsh this new module menu.

Check new your params of you modules which disappear.

Sorry for my bad english...

Thanks for the advice but no changes I make are changing the display.

The modules down the right hand side do not appear.

I have even tried changing the modules so they appear on all unassigned pages but this has not worked either.

Hi there,

any new solution for this??

I just upgraded a full functionally version 2.5.8 up to 3.0.3 and I had some probs with

- Modules which dont want to load anymore
- and others which appear without setting them into position

So I uninstalled the 3.0.3 and reinstalling 2.5.8 again.

Unfortunately my module position problem is still actual.

Thanks for your help!

well, in my case I have solved the problem.

It was a misconfiguration of my sh404sef component. As I was creating new link to my reinstalled alphaContent, sh404sef logical was treating it as a new component which required a new setup.
