## newbie Help!

Posted by mike305 - 2008/02/18 20:18

---

:dry: Can anyone please tell me how to configure Alpha Content for 1.5 joomla.

The Demo site looks so nice is it just using Alpha Content or do I have to download more files to make mine look like that? [http://tigers.visualclinic.fr/index.php?option=com\\_alphacontent&Itemid=57](http://tigers.visualclinic.fr/index.php?option=com_alphacontent&Itemid=57)

Can anyone give me a Step by Step for my first directory post? I am a fast learner I just need a push in the right direction

If this has already been asked please if you can post the link. I have tried searching the forums;)

I had to try around a little bit too, but it's simple you've to assign AlphaContent to a menu position and then it works :)

I hope I could help you!

Best regards,  
Andy

:sick: No I figured out the problem for myself .. this board has the worst response time in the world!

I was doing everything correct as far as configuring alpha content for my site.. the problem was I was getting was a 404 error. This is because of Smart SEF... which is a problem a lot of people run into. In the read me shows different Url friendly fixes

SEF instructions :

Artio JoomSEF : custom name (AlphaContent menu) = alphacontent

Sef Advance : custom name (AlphaContent menu) = same custom name in settings Sef Advance component

OpenSEF : custom name (AlphaContent menu) = same custom name in settings OpenSEF component

If error : edit the administrator\components\com\_sef\core\sef.resolver.php line 390

replace

```
$this->output .= ($url != '&' ? '&' . $url : $url);
```

by

```
@$this->output .= ($url != '&' ? '&' . $url : $url);
```

Also there is a hack at the Smart SEF web forum to fix it <http://www.smartsef.org/forum/>
