## Text Field: Homepage URL

Posted by leo1969 - 2008/03/05 13:31

---

Hi,  
i'm using mXcomment since several days. It works fine and is actually the best free Comment Component. Two wishes for future versions: First! A text field called "Homepage" for the user comments fill-in form. This field should be linked with the user name which is shown in the comment box. This is a feature that other CMS like WP originally have implemented. The second wish is that mXComment supported more Avatars. Mainly via Wordpress API. Cause the most Bloggers who comment my articles have WP. And it would be nice to have their Avatars nearby the commentbox. Like it functions with Gravatar. Or in the best way... mXcomment can use the Favicon or both?

Thanks for mXcomment. It replaced JomComment! :laugh:

Best regards from Berlin
