
Content width showing wrong

Posted by b9sinner - 2008/05/27 03:28

on my test site here http://www.lamba.se/Joomla_RT_Chromatophore/

my alphacontent is showing the text wrong. Text is too pushed together, even though there is space to the right the text only gets the width half of the space.

it's really weird, why doesn't it work if I use 3 columns.... please anyone know what files to edit= I'm using the latest one 3.0.4

if I use 2 columns the text shows up right. but I need to have it like this.

any clues? :pinch:

please, do anyone know why the text is showing up like this check the demo page

The date, hits, comment, vote and readmore is in a row, like it should be, but the text isn't working, when I use template design with 2 or 1 columns it works, but I really need 3. so what file do I need to edit for this to work ???

any clues or help??

THE Intro content text only gives me a width as shown below

if this is the
text it only gets
wide as this

It really sucks! but if I write a long word, or with dots like this as shown below.

.....
the text is shown normal? , so I've made those dots white as my background
and now the text shows normal in my articles, but the area gives some too much whitespace... :(

anyone know how to style the content with . I've gone through all files and all widths are 100% . but still can't find the problem?
